Re: Gasoline in the sanitary sewer in the 1200 block of South Glenstone

At 4:25 P.M. on Thursday, January 13, 1983, Randy Lyman received a call from Smith-Glenn-Calloway Clinic, 1211 S. Glenstone, stating that they had a gasoline odor in their building. They explained that they removed a trap to replace it and noticed the gasoline smell. When the new trap was installed the smell went away. Smith-Glynn was not concerned about their building, but thought we might want to know that there was gasoline present in the City's sewer line.

This is a reoccurring problem in this particular area of town. There are two service stations within a two block area on Glenstone that have had underground gasoline leaks within the last five years. Consequently, we are constantly getting small amounts of gasoline in the sewer line. These two service stations are connected to the same City sewer line the Smith-Glynn is attached to.

J. D. Slaughter and myself contacted Mr. Steve Webb, Chief of Maintenance for Smith-Glynn, at 9:00 A.M. on January 14, 1983. Mr. Webb explained that they wanted the City to be aware that there was a problem in the City's sanitary sewer line. The L.E.L., in all the manholes in Glenstone between Grand and Meadowmere, was checked and found not to be greater than 10%.

We will continue to monitor this situation in the future.
